

# **Recent Advances in Access Control**

by

**Amit Konar**

Dept. of Math and CS, UMSL

# Closed Policy

## Examples

Give Jim read access to foo.

Give Bob r/w access to bar.

Jim: I'd like to read foo.

- Access is granted

Jim: I'd like to read bar.

- Access is denied.

**Why call Closed Policy ? –Only those with access right can perform r/d operations.**

# Open Policy

## Examples:

Deny Jim read access to foo.

Deny Bob r/w access to bar.

Jim: I'd like to read foo.- access is denied.

Jim: I'd like to read bar.- access is denied.

**Why Open Policy: Because anyone  
except those listed here have access.**

# Closed Policy with Negative Authorization and Denial-takes-precedence

## **Examples:**

Give Jim r/w access to foo.

Deny Jim w access to foo.

Jim: I'd like to read foo.- Access granted.

Jim: I'd like to write foo.- Access denied.

**Denial is given priority for security reasons.**

# **Closed Policy with Negative Authorization and Most specific Authorizations take precedence**

## **Examples:**

Give CS students r/w access to foo.

Deny Jim w access to foo.

Jim: I 'd like to read foo. – Access granted.

Jim: I 'd like to write foo. – Access denied.

**Jim's denial on write access to foo is most specific and thus takes precedence.**

# **Closed Policy with Negative Authorization and Most Specific Authorizations take precedence**

## **Examples:**

Deny CS students r/w access to foo.

Give Jim r access to foo.

Jim: I 'd like to read foo.-Access granted.

Jim: I'd like to write foo.- Access denied.

**Here also, the most specific authorization took precedence.**

# Separation of Duties

Prevention by fraud and errors is by far the dominant security issue in commercial organizations.

No individual is given sufficient authority to perpetrate fraud on his/her own.

This is achieved by breaking larger actions into smaller steps executed by distinct individuals.

# Static Separation of Duty

1. A clerk prepares a voucher and assigns an account.
2. The voucher and account are approved by a supervisor.
3. The check is issued by a clerk **different** from the clerk in step 1.

**It will take two clerks and a supervisor to perpetrate fraud.**

# Dynamic Separation of Duty

## Example:

A particular clerk is prohibited from performing steps 1 and 3 for the same voucher. However, he/she can perform step 1 on some vouchers and step 3 on some other ones.

# A Predicate Logic Based Language for Access Control

An authorization is of the form:  $(s, o\langle\text{sign}\rangle, a)$

An authorization specification AS consists  
of a set of:

authorization: **cando**

derivation: **dercando**

conflict resolution: **do** (avoiding  
over/under specification)

Integrity: **error**

# Authorization Rule

Used to specify accesses to be allowed or denied

$\text{cando}(o, s, \langle \text{sign} \rangle a) \leftarrow L_1 \& L_2 \& \dots \& L_n$

where  $L_i$  is in, typeof literals.

**Examples:**  $\text{cando}(\text{file1}, \text{CS-dept.}, +\text{write}) \leftarrow.$

$\text{cando}(\text{file2}, s, +\text{write}) \leftarrow \text{in}(s, \text{CS-faculty}).$

$\text{cando}(o, \text{Secretary}, +\text{write}) \leftarrow \text{typeof}(o, \text{Letters}).$

$\text{cando}(\text{file1}, \text{George}, -\text{write}) \leftarrow.$

# Derivation Rule

Used to derive implied authorizations

**dercando(o, s, <sign>a) ← L<sub>1</sub> & ... & L<sub>n</sub>.**

where L<sub>i</sub> is cando, dercando, in or typeof literal.

dercando(o, s, +a) ← cando(o, s', +a) & in (s, s').

dercando(o, s, -a) ← cando(o, s', -a) & in(s, s').

dercando(file1, s, -read) ← dercando  
(file2, s, read)

# Resolution Rule

States that a subject must be allowed/forbidden to exercise an access:

**$\text{do}(\text{o}, \text{s}, \langle \text{sign} \rangle \text{a}) \leftarrow \text{L}_1 \& \dots \& \text{L}_n.$**

**where  $\text{L}_i$  is cando, dercando, in, done or typeof literal.**

$\text{do}(\text{file1}, \text{s} + \text{a}) \leftarrow \text{dercando}(\text{file1}, \text{s} + \text{a}).$

$\text{do}(\text{file1}, \text{s}, +\text{a}) \leftarrow \neg \text{dercando}(\text{file1}, \text{s}, -\text{a}).$

# Done Rule

**$\text{done}(o, s, R, a, t) \leftarrow.$**

This rule is true if a subject  $s$  with roles in  $R$  active has executed action  $a$  on object  $o$  at time  $t$ .

Useful for policies in which future accesses are based on those in the past.

# Closed Policy in Authorization Specification Language (ASL)

$\text{dercando}(u, o, +a) \leftarrow \text{cando}(s, o, +a) \ \& \ \text{in}(u, s).$   
 $\text{do}(u, o, +a) \leftarrow \text{dercando}(u, o, +a).$   
 $\text{do}(u, o, -a) \leftarrow \neg \text{do}(u, o, +a).$   
 $\text{error}(s, o, a) \leftarrow \text{cando}(s, o, -a).$

# Denials take precedence

$\text{do}(u,o,-a) \leftarrow \text{dercando}(u,o,+a)$   
 $\quad \& \text{dercando}(u,o,-a)$

$\text{do}(u,o,-a) \leftarrow \neg \text{do}(u,o,+a)$

# Static Separation of Duty

**error() ← do(s, budget, submitting)  
& do(s, budget, evaluating)  
& do(s, budget, approving).**

Same person  $s$  cannot do submission, evaluation and approval of budget.

# Dynamic Separation of Duty

```
error() ← done(u,o,R, submitting, t)
         & done(u,o, R', approving, t')
         & done(u,o,R'', approving, t'')
         & typeof (o, Order).
```

Here, subject  $u$  plays three roles in three different times.

# Formalization of Role Based Access Control

Defn.1: A **role** is a collection of job functions. Each role  $r$  is authorized to perform one or more transaction (actions in support of a job function). The set of authorized transactions for  $r$  is written as **trans( $r$ )**.

# More Definitions

**Defn. 2:** The **active role of a subject  $s$** , written  **$\text{actr}(s)$** , is the role that  $s$  is currently performing.

**Defn. 3:** The **authorized roles of a subject  $s$** , written  **$\text{authr}(s)$** , is the set of roles that  $s$  is authorized to assume.

**Defn. 4:** The predicate  **$\text{canexec}(s, t)$**  is true if the subject  $s$  can execute transaction  $t$  at time  $t$ .

# Rules to Execute a Transaction

**Axiom 1:** Let  $S$  be the set of subjects and  $T$  be the set of transactions. The **rule of role assignment** is

$$(\forall s \in S)(\forall t \in T) [\text{canexec}(s, t) \rightarrow \text{actr}(s) \neq \emptyset]$$

This means that if a subject can execute any transaction, then he has an active role.

**Axiom 2:** Let  $S$  be the set of subjects. Then the **rule of role authorization** is

$$(\forall s \in S) [\text{actr}(s) \subseteq \text{authr}(s)].$$

This means that the subject must be authorized to assume its active role.

# Rule of Transaction Authorization

**Axiom 3:** Let  $S$  be the set of subjects and  $T$  be the set of transactions. The rule of transaction authorization is

$(\forall s \in S) (\forall t \in T) [\text{canexec}(s, t) \rightarrow t \in \text{trans}(\text{actr}(s))].$

It means that the subject cannot execute a transaction for which its current role is not authorized.
